

## CAPTURE CLIENT 3.0 GIVES MSSPS A CRITICAL ADVANTAGE

Established in 1989, Western NRG has been providing Wide Area Networking solutions to customers all across North America for more than a quarter-century. The Western NRG team grew its expertise from simply connecting networks together, to tightly securing them as well. Today, they serve customers all over North America in a variety of market segments.

Having gone through the beta and release of the Capture Client 3.0, Senior Security Engineer, Nathan Orlina who lead the beta review process, had to say that "Client 3.0 has taken our management of client machines to the next level by adding additional value to an already valuable solution."

New to the endpoint security suite is Application Vulnerability Intelligence which gives MSSPs like Western NRG the ability to not only see what applications are installed on endpoints but also which ones are vulnerable. Orlina continues "the Application Vulnerability Intelligence feature gives us additional insight into vulnerable applications with quick links to CVEs for an easy customer deliverable. This is an incredible feature especially as more and more users are working from home on their personal devices. It's important to know what vulnerabilities exist on systems we previously did not have to manage."

To aid in their ability to better manage endpoint security Western NRG found "the enhancements to notifications means that every alert [they] receive from Capture Client is deliberate and actionable."

Since more people are working from home than ever, providing more intelligent control over web activities is essential to creating granular policies to uphold security and help bolster productivity. For this reason, Western NRG feels that "the new Content Filtering feature allows us to extend our network access policy beyond the previous boundary of the office and into the global workspace."

Orlina continues "We are very happy with the new feature set of Capture Client 3.0 and will continue to offer it to our customers above all other endpoint protection products!"

### Benefits

- Create granular policies over web usage
- Gain visibility into install applications and their vulnerabilities
- Active Directory integration to create policies by user group

### Solutions at a glance

- Capture Client 3.0

"Client 3.0 has taken our management of client machines to the next level by adding additional value to an already valuable solution."
